

A VOICE COMPANION • OPEN SOURCE

How *was* your day?

Call in, talk it through, hang up — and it remembers you next time.

just a phone call

◆ remembers you

web or voice

— THE PROBLEM

Most journaling apps die on *one friction*.

They ask you to **type**. At 11pm, tired, nobody opens an app and writes paragraphs — so the habit never sticks. The blank page wins.

THE USUAL ASK

"Open the app. Pick a prompt.
Type how you feel..."

activation energy: high · done by: almost no one

WHAT PEOPLE ACTUALLY DO

Tell a friend about their day
— out loud, unprompted.

activation energy: ~zero · the format we already use

— THE IDEA

So make it a *phone call*.

Dial the number like you'd call a friend. Talk through your day. Hang up. No app, no sign-up, no blank page — and next time, it already knows you.

1 Your phone number is your identity

2 Talk — it answers in the first half-second

3 Hang up — it keeps what mattered

Hey, welcome back. Did the presentation end up happening?

It did. Went better than I feared.

I had a feeling. You were pretty nervous about it last time. ♦ remembered from your last call

— THE DESIGN TENSION

A voice you'd actually call back has to be two things
that pull against each other.

Instant

answers in the first half-second,
like a friend who picks up

vs

Intimate

remembers you
between calls

Fast usually means stateless. Memory usually means slow. **Every design choice serves one — or the tension between them.**

— UNDER THE HOOD

Four pieces, each earning its place.

Nothing fancy — the craft is in *which* piece runs *when*. Two serve "instant," two serve "intimate."

Cartesia Line

the voice — telephony + low-latency speech

instant

OpenRouter

the model — gemini-2.5-flash, swappable

instant

Upstash Redis

the fast profile card on the hot path

intimate

Mem0

the deep, semantic memory — on demand

intimate

— THE CALL, END TO END

One identity, *one agent*.

Everything is keyed by your phone number — no scan, no cross-user read path.

1 On call

Resolve the caller → load their memory → build a personalized **TodayAgent** with its own prompt & greeting.

`get_agent · LlmAgent`

2 During the call

Reply instantly from the profile card. A background tool recalls deeper memory **only** when you ask about the past.

`recall_memory · on demand`

3 On hang-up

Extract structured info from the transcript and persist only what matters — people, threads, mood.

`CallEnded · extract → save`

— INSTANT · THE HOT PATH

The greeting can't *wait*.

A small profile card lives in Redis, fetched **by key** — no scan — with a per-worker in-process cache. That's what lands the hello in the first half-second, before any heavy lookup runs.

fetches by key · no scan

per-worker cache

latency-critical

PROFILE CARD · REDIS

```
{
  "name": "Ankit",
  "people": ["Maya", "the team"],
  "open_threads": ["the big presentation"],
  "mood_trend": "lighter this week"
}
```

one GET, no query planner — the whole "who is this?" in a single round-trip.

Depth, only when *you ask*.

The semantic memory lives in **Mem0**, hosted. We send raw turns; it enriches and embeds them server-side. It's touched only when you reach for the past — *"remember when..."* — so the hot path stays clean.

written post-call

searched mid-call

on demand only

"Did I ever tell you how the Lisbon trip went?"

... searching memory...

You did — you said the second day, by the water, was the calmest you'd felt in months.

✦ recalled from Mem0

— THE TRICK

Hide the one moment it *isn't* fast.

Semantic recall takes a beat. So when it fires, a short **filler line** plays while the lookup runs — and the pause disappears into the conversation.

CALLER ASKS → "Remember when..."

ECHO SAYS → "Mmm, let me think back..."

↳ Mem0 search runs underneath

The win wasn't making it fast everywhere. It was *covering the seam*.

— WHAT IT KEEPS

Remember less, *on purpose*.

A journal that saves everything is noise. On hang-up it keeps only what makes the next call feel known — and forgets the rest.

KEPT

- ✓ who you are & the people in your life
- ✓ open threads — what you're dreading or chasing
- ✓ mood, over time

DROPPED

- ✗ small talk & filler
- ✗ one-off logistics
- ✗ anything about other people, not you

Curation *is* the feature — it's the difference between surveillance and being listened to.

— TWO FRONT DOORS

One brain, *two ways in*.

The same agent and the same memory, whether you call or type.
Only the identity key changes.

Call in

Dial the number from any phone. Identity =
your `E.164` number.

Talk on the web

Sign in by email, talk from the page. Identity
= `web:hash(email)`.

Same agent.

Same memory.

One codebase serves both — the front
door is just an identity scheme.

— WHAT I'D LEAVE YOU WITH

For a companion, *latency is the product.*

And the craft is hiding the moment it isn't fast. The model was the easy part — the *feeling of being remembered* was the work.

howzyour.day
